

Abstract

A bandage with cooling capabilities includes bandage support members and a cold pack member positioned between the support members. The cold pack member may be a chemical which endothermically reacts with water, positioned adjacent to but separate from a water source inside a common package, to instantly cool the cold pack member upon activation. The cold pack member further comprises a sterile pad member positioned on the bottom side of the bandage, which may include an antibiotic, anesthetic, antipyretic, burn medicament, or combinations thereof.
